

## MSG 094A - BLUE FD08 MISSION SUMMARY

1 Good morning gentlemen. Time to get back to work. By the time you read this, we may  
2 have a much better idea if the WSA IFM will be required. With a VCD run under our belt, we  
3 understand the heat loads much better. We'll let you know in the DPC.

4 The CM-2 LSP science team really appreciates Mike "burning" some of his off duty time with  
5 an extra LSP test. The additional test data was a boon to the LSP team and your efforts  
6 were a valuable contribution to the LSP investigation. The LSP team enjoyed working with  
7 the entire crew and wants to pass on a big THANK YOU for all your extra effort towards  
8 making LSP a SUCCESS!

9 Great job on the moon cal and sprites today! We've gotten some incredible pictures from  
10 the Sprites - MEIDEX believes they may have captured new phenomena in the upper limb  
11 region. SOLSE is still performing data analysis on the limb view but their science set has  
12 already exceeded the SOLSE-1 mission by over 500%! CVX is continuing  
13 nominally towards the critical temperature. SOLCON data looks great and LPT continues to  
14 prove just how well their system works.
