3.1.2		TRIGGER ASSEMBLY (1), SED27161362	I/I	3.1.2 Mode: Fails to release pole Cause: • Contamination • Corrosion	Unable to deploy pole	<p>1. Design features: The design features which minimize the probability of this failure mode are:</p> <ul style="list-style-type: none"> a. The trigger assembly is fabricated with components not conducive to corrosion. b. The trigger and trigger rod are fabricated of inconel 718 material, specification AMS 5662. The trigger bracket and bracket ears are fabricated of 6061-T65 aluminum, specification QQ-A-250/11. The lever assembly, switch cover, trigger pin, and leaf springs are fabricated from steel, also in accordance with AMS specifications. The aluminum parts are anodized and the inconel and steel parts are passivated after machining. All fasteners used during the assembly and installation process were selected in compliance with the 1.4 factor of safety. c. Cover plates are placed over inspection ports in the PCES housing to prevent entry of contamination to the trigger assembly components that interface with the primary and extension poles. The PCES is stored in the Orbiter crew cabin which is maintained clean and free of contamination that would affect the trigger assembly external components. d. All fasteners are torqued in accordance with engineering design requirements, and internal parts are installed with vibratite and/or self-locking inserts. e. The trigger assembly was designed to a safety factor of 1.4.

312		TRIGGER ASSEMBLY (1), SED27101362	1/1	3.1.2 Mode: Fails to release pole Cause: • Contamination • Corrosion	Unable to deploy pole	<p>b. Inspection/QA/Manufacturing</p> <p>a. All PCES fabrication, assembly, and test activities were performed under the jurisdiction of the NASA JSC Quality Assurance (QA) Division in accordance with JSCM 5312 SR&QA Manual Requirements. QA surveillance was provided for procurement, planning, processing, fabrication, assembly, certification testing, and acceptance testing. Mandatory inspection points were employed at appropriate points in the fabrication, assembly and acceptance process.</p> <p>b. Receiving inspection verified that materials provided by suppliers were as identified on the procurement documents, and that data was provided attesting to the traceability and acceptability of materials and components received from suppliers</p> <p>c. All of the trigger assembly components were fabricated of aerospace approved materials by trained technicians. QA inspections performed during the fabrication, assembly, testing, and acceptance process verified:</p> <ul style="list-style-type: none"> (1) Use of correct, approved materials (2) Cleaning of parts and assemblies in accordance with JSC Manual SJ22, paragraph 7.1.3 to level GC (3) Inspection of surfaces assuring proper surface preparation prior to application of special surface coating processes (4) Anodizing of aluminum surfaces as specified on engineering drawings, passivating of nickel and steel components, as defined by drawings (5) Proper installation and handling of components and controlled application of lubricant and thread locking compounds in accordance with drawing requirements
