FAILURE MODE AND CAUSE	FAILURE EFFECT ON END ITEM	RATIONALE FOR ACCEPTANCE

Loss of iris function (mechanical).
 Loss of zoom function (mechanical).
 Loss of focus function (mechanical).

MLA
 Motor Failure
 Gear Train Failure
 Lens Failure

Inability to control focus, zoom, or iris.
Worst Case:
 Loss of mission critical camera video.

DESIGN FEATURES

The TVC/Lens Assembly is comprised of 16 electrical subassemblies; 13 subassemblies are RCA Astro designed and fabricated using standard printed-circuit board type of construction. The remaining three assemblies, high voltage power supply, oscillator, and stepper motors, are vendor supplied components which have been specified and purchased according to RCA Specification Control Drawings (SCDs) prepared by engineering and reliability assurance. Specifications per the SCD are prepared to establish the design, performance, test, qualification, and acceptance requirements for a procured piece of equipment.

Parts, materials, processes, and design guidelines for the Shuttle CCTV program are specified in accordance with RCA 2295503. This document defines the program requirements for selection and control of EEE parts. To the maximum extent, and consistent with availability, all parts have been selected from military specifications at the JAN level, as a minimum. In addition to the overall selection criteria, a subset of general purpose preferred parts has been defined by this document and the RCA Government Systems Division Standard Parts List. In the case of the CMOS and TTL family of microcircuits, devices are screened and tested to the MIL-STD-883C equivalent and procured under the designations of HI-KEL/3MQ and SMC 54LS from RCA-SSH and Texas Instruments Corp, respectively. Parts not included in the above documents have been used in the design only after a nonstandard item approval form (NSIAF) has been prepared, submitted to Reliability Assurance Engineering (RAE) and approved for use in the specific application(s) defined in the NSIAF by NASA-JSC.

Worst-Case Circuit Analyses have been performed and documented for all circuit designs to demonstrate that sufficient operating margins exist for all operating conditions. The analysis was worst case-in that the value for each of the variable parameters was set to limits that will drive the output to a maximum (or minimum).

A component application review and analysis was conducted to verify that the applied stress on each piece part by the temperature extremes identified with environmental qualification testing does not exceed the stress derating values identified in RCA 2295503.

In addition, an objective examination of the design was performed through a PDR and CDR to verify that the TVC/lens assembly met specification and contractual requirements.

FMEA NO. <u>5.1.B.2</u>	CRITICALITY <u>2/2</u>	SHUTTLE CCWV CRITICAL ITEMS LIST	UNIT <u>IYC/MIA</u> DWG NO. <u>2294B19-506.50B</u> <u>2294B20-502</u> SHEET <u>2</u> OF <u>11</u>
FAILURE MODE AND CAUSE Loss of iris function (mechanical). Loss of zoom function (mechanical). Loss of focus Function (mechanical). MIA Motor Failure Gear Train Failure Lens Failure	FAILURE EFFECT ON END ITEM Inability to control focus, zoom, or iris. Worst Case: Loss of mission critical camera video.	DESIGN FEATURES The general arrangement of the lens assembly is to provide an integrated housing, motor, and circuit board package which can accommodate various commercially available lenses. Emphasis is placed on accessibility of the lens, its drive components, and limit stops. Components within the lens assembly have been modularized, serving both the MIA, CLA, and WLA assemblies. The lens housing structure is a one-piece casting designed to minimize machining and provide a rugged dimensionally stable mounting for the optical components. The housing is in the form of a right angle. The vertical member interfaces with the front surface of the camera and the horizontal member supports the drive motors on the upper surface with the lens function circuit boards in a cavity on the underside.	RATIONALE FOR ACCEPTANCE <u>Lens Function Drive Train</u> The iris, zoom, and focus drives are identical in concept; the only difference is the lower gear ratio in the iris train to provide the 2.8-second end-to-end travel capability necessary for the ALC operation. The table (on next page) shows the drive train parameters with overall torque margins for the three lens functions. The motor/gear heads are mounted on the lens housing rather than on the lens, to permit the desired lens interchangeability for the Shuttle mission with minimum impact on the actual lenses. Various types of motors were considered for this application, trading off size, power, weight, control-circuit complexity, command capability, and qualification status. The brushless and stepper-motor types fit the package and power requirements, the latter being preferred because of its simplicity, reliability, and space-qualified status. The selected stepper motor (a size-8, Alnico-9 pole-piece, permanent-magnet stepper) is mated with a spur train gearhead. Both units are manufactured by Monac Motor Co. A 40-diametral-pitch (40-DPI) spur gear on the gearhead output shaft meshes directly with the gears which are a part of the zoom, focus, and iris ring functions on the lens gear.
